As a result of a series of state and federal initiatives, sediment cleanup and habitat restoration within Puget Sound has become a top priority in the state of Washington. Anchor Environmental has a key technical role in these efforts. Working over the past 10 years on behalf of a wide range of industry, port, and municipal clients, Anchor has developed a reputation as one of the leading sediment management and restoration firms within the United States. Anchor's success in completing numerous sediment cleanup and related habitat restoration projects—projects that have been constructed and are performing as designed—has been the basis for our reputation as leaders in this field. The recently renewed focus on the health of Puget Sound has increased interest in cleaning up additional sites and concurrently constructing more functional aquatic habitat.

In June, Anchor was selected by the US Army Corps of Engineers, Seattle District, to lead a diverse consultant team supporting completion of the Puget Sound General Investigation (GI). The GI is the basis upon which the federal government evaluates the feasibility of major habitat restoration programs for Puget Sound, similar in many respects to the current restoration effort in the Florida Everglades. The Seattle District Corps of Engineers is working in partnership with the state of Washington to complete the Puget Sound GI.
